

Why the medical scientists prefer cannabis for treatment?

Over the years the main concern for the medical scientists has been the cost of treatment and also the potential of the drug used towards treatment of the ailment. It is also necessary to assess properly the potentiality of harms that could be caused by the cannabis drugs.

The only thing that they have time and again pointed out is that excessive use of graine de cannabis should be avoided. In any case, excessive use of anything is always bad. For sometimes there were demands of criminalization of cannabis but it did not get effective support from the authorities in different countries.

Human rights and legal issues

It has been very often held that the preventive laws put in place against the use of marijuana and other cannabis seeds are more harmful to human beings than the Graine cannabis itself. In addition there are the fiscal and social costs involved in such prohibitive legislations.

Once person uses cannabis, such legislation tends to attach a stigma to him or her resulting in his or her career, reputation and social status being damaged, often without any reason.

More people have seen shattered family and reputation being addicted to alcohol than those who have used cannabis. It also often drives a wedge in the family, between the parents and children, and between the generations furthering the already existing generation gap and causing distress to all concerned.

Health professionals on the other hand find that there are many positive impacts of use of cannabis at least in critical diseases. It cannot be overlooked that despite the ban, use of cannabis has become a normal factor throughout the western world.

There are several other harmful drugs that have far more evil impacts compared to the cannabis without having any of its good and positive qualities. In any case, liberalization of controls may not increase the use of the cannabis to that extent.

Prohibition is more political and less scientific

Most of the people including many medical scientists feel that the prohibition clamped on cannabis seed is more due to political reasons and less due to scientific ones.

It is also a well accepted theory that attempts to control graine de cannabis by prohibition have miserably failed. In some cases the use is even professed if it is felt that it may ultimately protect the public health.

On the other hand there is no conclusive evidence to indicate that Graine Cannabis prohibition has really helped the people by protecting their health and welfare. Till date no scientific or medical reasons have been propounded in support of prohibition of cannabis. Experience has already shown that more intensive law would not achieve better outcome in the field of public health.

Conclusion

There is hardly any drug whether graine de cannabis or others that is free of risks. Even the most potent drugs including the vitamin pills have their own risks. The greatest risk is that of overdose.

Cannabis may not be completely harmless but so far experience has revealed that adverse impacts on the health condition of the user have been minimal.

It is a matter of prudent and judicious use without getting to overdose like any other drug in the market that could make your use of cannabis seeds safe and sound.

About the Author

The feedbacks and blogs that you can see on this website will be a real revelation for you. It includes the opinions not only from the [cannabis](#) users but many experts in the field who have vast technical experience.
